Part 2 start with PHP This is a small part file that calls JS file of a scraping system Client calls, appt set, that runs on an client gives attorney to Ubuntu (not **Ubuntu Cloud Server** file that leads and is partially another scraping scraper to correct operated from mobile phone day after lawsuit has actually been filed. To comply with Bar IIM file calls PHP letter can only be Script that parses Cleaner is run which sent AFTER client the pages to get all relevant mailing and DB content from with lawsuit. The next scraping puts into MySQL DB served on potential Part 1 (the hotsheet the Ubuntu Task Scheduler. PHP file calls a series of files converts MySQL into Output of this Excel file and then is downloaded to local file calls an lopus Macro file. This downloaded as Excel drives the scrapers and downloads look at this too them. JS file sets Output must be looping. Attorney to comply Selected output with Bar Rules Server DB from Excel via SSIS **Downloaded Pages** are Parsed and MySQL DB from PHP Script called by the IIM file. **SQL Server mail** merge with MS that tell people that lawsuits against into DB and converted to CSV datasource for Part filing for
